Hi Richard,

Thank you for showing interest to my application.

What I understand from the requirements given by you is, you need to deploy your docker image to other remote hosts. They can be from any platform.

Docker does have this functionality to run containers on remote hosts.

I found below 2 documents. I plan to implement them.

1. https://www.docker.com/blog/how-to-deploy-on-remote-docker-hosts-with-docker-compose/
2. https://www.digitalocean.com/community/tutorials/how-to-use-a-remote-docker-server-to-speed-up-your-workflow

I plan to do this but I have following assumptions/queries:

1. All hosts are already fixed. There are no dynamic hosts.
2. All hosts have docker engine/server or are we supposed to install it. This would be 1-time activity. No issue on installing it.
3. Do you want script for installing docker engine on all hosts?
4. I assume you only need script to run docker container on all hosts.
